Dear Colleague:

For more than two decades, Dr. Fred Singer has been one of the most effective voices in opposition to the myth of human-caused global warming – perhaps the most effective voice, if measured by the intensity of unprincipled attacks directed against him by the enviro industry. Enclosed is a recent analysis by Dr. Singer and his colleagues of many of the subjects currently discussed regarding this issue.

The American people now import one-third of their energy, even though most of the world's energy-production technology was invented by American engineers and scientists. Unfortunately, taxation, regulation, and sponsorship of litigation imposed by the government of the United States have made our country a very unfavorable place for the business of energy production. The domestic energy industries that generate the two-thirds that we do produce were built before these disincentives became overwhelming.

Development of our nuclear energy industry was stopped by lies – lies that misled the American people. Now, very similar lies – the hoax of human-caused global warming – are being used to not only stop development of our hydrocarbon energy industries, but also to dismantle those already built.

If the taxation, regulation, and litigation now directed against our energy industries are not reduced – actions opposite to those advocated by most of the politicians elected this past November – our energy-requiring technological civilization will severely decline, as will the prosperity of the American people. As a result, our freedom and the freedom of people throughout the world will also greatly diminish.

Please read the enclosed report. We have no defense against the lies of our enemies except the truth. Each of us should be armed as effectively as possible with that truth.

Sincerely,

Arthur B. Robinson, PhD
